Anadromous species (Atlantic salmon, sea run brown trout, shad, alewife)	10

INTRODUCTION

The State of Connecticut has used fish-culture techniques to augment, enhance and/or restore populations of native and introduced fish species for over one hundred years. Currently, cultured salmonid species are brown trout, brook trout, rainbow trout, "tiger" trout (a brown trout/brook trout hybrid), Atlantic salmon and kokanee salmon (a landlocked form of the anadromous Pacific sockeye salmon). The DEP has established, and is currently expanding popular fisheries for walleye and northern pike by stocking fingerlings. Anadromous clupeids (American shad and alewife) are being transplanted in efforts to restore runs.

TROUT: DEP stocks trout into waters that have suitable habitat and are open to public fishing. In 2005, the Inland Fisheries Division stocked a total of 747,600 adult and "specialty" trout in 198 rivers and streams and 99 lakes and ponds. Adult trout are 9-12 inches in length. Specialty trout are larger, generally in the 12-14 inch range, but some are larger including broodstock weighing 2-10 pounds. DEP also stocked 24,000 yearlings (7-9 inch trout), and over 430,000 fry and fingerlings (1-6 inch trout). In 2005, slightly over 51% of the adult trout stocked were brown trout, 33% were rainbow trout, and 14% were brook trout. Specialty trout were mostly larger brown trout and rainbow trout, but also included 11,600 10-12 inch "tiger" trout (a brook trout /brown trout hybrid).

Springtime trout distribution generally begins in early March and continues through the end of May. More than half the year's trout are stocked prior to opening day (424,500 trout in 2005). Due to its favorable temperatures and flows, the Farmington River is stocked several times for the summer holidays. Approximately 25 lakes and 20 rivers (including a number of Trout Management Areas) are stocked again in October to enhance fall and winter trout fishing. In 2005, over 45,000 trout were stocked in the fall, although due to an extended period of low stream flows during the summer and early fall, several areas typically stocked in the fall were not stocked or stocked at reduced rates.

Innovative management tools such as minimum lengths, reduced creel limits, catch-and-release only areas and wild trout areas are used to enhance angler opportunities in selected areas. Although these special management areas (Trout Parks, Trophy Trout Streams & Lakes, Trout Management Areas and Wild trout Management Areas) are perhaps the most noticeable and popular trout fishing areas, two-thirds of the catchable-sized trout stocked in Connecticut are released into "open areas" (where no special regulations apply).

KOKANEE SALMON: Kokanee are a land-locked form of the Pacific sockeye salmon. The DEP currently maintains a kokanee salmon fishery in West Hill Pond (New Hartford/Barkhamsted). Mature kokanee are trapnetted from West Hill Pond and transported to the Burlington State Trout Hatchery for spawning during the fall. Additional eggs are sometimes obtained from out-of-state sources (when available) to reach stocking goals (approximately 50,000 fry per year). After eggs are incubated and hatched, kokanee fry and fingerlings are reared and stocked in the spring. Historically, popular kokanee fisheries existed in East Twin Lake and Lake Wononscopomuc, however, these fisheries collapsed following illegal introductions of landlocked alewife. In 2005, 54,000 fry were released into West Hill Pond. Due to a surplus of eggs, an additional 53,000 fry were also released into East Twin Lake and 51,000 fry were stocked into Lake Wononscopomuc.

NORTHERN PIKE: Northern pike fisheries are developed and maintained by stocking fingerlings (3 - 8") that are raised in managed marshes. Pike reproduction and fry survival are maximized by managing water levels, vegetation types and by limiting undesirable fish species in marshes at

Haddam, Kent, Litchfield and Mansfield. Offspring from Bantam Lake pike are collected and stocked back into that lake. Juvenile pike produced from other marshes are stocked into the CT River, Mansfield Hollow Reservoir (since 1992), Pachaug Pond (since 1999), Quaddick Reservoir (since 1999) and Winchester Lake (since 2001). Nearly 24,000 pike fingerlings were stocked in 2005.

WALLEYE: DEP began to develop walleye fisheries in 1993. Walleye fisheries are created by annual stockings of 4 to 6 inch fingerlings at rates of 8-15 per acre in each lake. Walleye fingerlings are obtained from suppliers located in the Mid-West. The fisheries in each lake are evaluated annually by monitoring the growth and abundance of walleyes and other fish species and by monitoring angler effort and fishing success. Currently, walleye fisheries are established in Gardner Lake, Squantz Pond, Lake Saltonstall and Saugatuck Reservoir. In 2001, walleye stocking was expanded to include Batterson Park Pond, Beach Pond, Coventry Lake, Lake Housatonic, Mashapaug Lake and Tyler Lake. Stocking of Tyler Lake was terminated after 2003 due to little or no survival of stocked walleye. DEP also stocks walleye and monitors their populations in Lake Pocotopaug (East Hampton) and Lake Terramaugus (Marlborough). The fish for these two lakes are purchased by the respective towns. In 2005, DEP stocked nearly 55,000 walleye fingerlings into the eleven lakes (over 46,000 were stocked into the nine public lakes).

BROODSTOCK ATLANTIC SALMON FISHERY: Surplus broodstock Atlantic salmon are stocked into the Naugatuck and Shetucket Rivers to provide a recreational fishery for Atlantic salmon. These salmon were raised in hatcheries to provide eggs for the Connecticut River Atlantic Salmon Restoration Program and are the progeny of sea-run salmon that returned to the Connecticut River. The stocked salmon are either barren (without eggs) or surplus spawned fish that will be replaced by younger salmon. Stocked broodstock Atlantic salmon are two to five years old and generally weigh between 2 and 20 pounds each. The number of stocked broodstock can vary widely from year to year, generally ranging from 800 to 1600 fish. A total of 1,806 broodstock salmon were stocked into the Naugatuck and Shetucket Rivers during the 2005 season (October – December). This is the second greatest number of broodstock salmon ever released by the DEP (the previous record was the 1,873 fish stocked in 2004). DEP's Kensington Hatchery produced 1,006 of these salmon, and the other 800 salmon were obtained from the federal hatchery at White River Junction in Vermont.

ATLANTIC SALMON RESTORATION PROGRAM: Each year the DEP stocks approximately 1.5 million juvenile salmon (fry, parr and smolts) as part of the effort to restore Atlantic salmon to the Connecticut River watershed. In 2005, totals of 1,542,721 fry and 36,732 smolts were stocked into Connecticut River tributaries (the Farmington, Salmon and Eightmile River systems). Anglers are reminded that fishing for Atlantic salmon in Connecticut is prohibited with the exception of the broodstock fisheries (see above).

SEA-RUN BROWN TROUT: DEP continues efforts to develop and enhance runs of sea-run trout in selected coastal streams. In 2005, over 66,500 juvenile brown trout (fry and parr) were stocked into streams with suitable habitat.

RESTORATION AND ENHANCEMENT OF ANADROMOUS CLUPEIDS: DEP is actively working to restore and enhance anadromous American shad, alewife and blueback herring runs in Connecticut by removing obsolete dams, building fishways that allow fish to migrate past remaining dams and transplanting pre-spawn adults from streams with healthy runs to targeted rivers having suitable habitat and water quality. In 2005, 227 American shad and 2,997 alewife were transplanted.

Connecticut Inland Fisheries Division, Annual Fish Distribution Report for fish stocked in 2005
